

Claim 27 includes limitations similar to claim 26, and is also not anticipated by the teachings in the cited art for the same exact reasons set forth above. Hence, dependent claims 26 and 27 are patentable under the provisions of 35 USC § 102.

Conclusion

Thus, the Applicants submit that none of the claims, presently in the application, is anticipated under the provisions of 35 USC § 102.

Consequently, the Applicants believe that all these claims are presently in condition for allowance. Accordingly, both reconsideration of this application and its swift passage to issue are earnestly solicited.

Respectfully submitted,

November 13, 2001

Version of Pending Claims Without Markings

1 1. A method of controlling the intensity of a backlight
2 in a display device having a housing and also having a
3 screen mounted in the housing, the screen having a front
4 side comprising a viewing surface, the screen having a rear
5 side comprising a non-viewing surface, the display device
6 also having a first photo-sensor, and a second
7 photo-sensor, the first photo-sensor being positioned to
8 detect light at the front side, the second photo-sensor
9 being positioned to detect light at the rear side, the
10 method comprising:

11 using said first photo-sensor to detect the intensity
12 of light incident on the viewing surface;

13 receiving a brightness setting signal indicative of a
14 user selected brightness level;

15 using the second photo-sensor to detect the intensity
16 of light incident on the non-viewing surface, wherein the
17 light incident on the non-viewing surface comprises ambient
18 light originating from outside the housing and also
19 entering the housing from behind the non-viewing surface;

20 and

21 adjusting the amount of power supplied to a backlight
22 as a function of the detected light intensity incident on
23 the viewing surface, the received brightness setting
24 signal, and the detected light intensity incident on the
25 non-viewing surface.

1 2. The method of claim 1, further comprising the step of:
2 periodically repeating the step of adjusting the
3 amount of power.

1 3. The method of claim 2, wherein the step of
2 periodically repeating the step of adjusting the amount of
3 power is performed automatically by the display device
4 without user intervention.

1 4. The method of claim 3, wherein the screen is a
2 transmissive liquid crystal display screen.

1 5. The method of claim 1, further comprising the step of:
2 receiving a brightness setting signal indicative
3 of a user selected brightness level; and
4 wherein the step of adjusting the amount of power
5 supplied to the backlight is also performed as a function
6 of the received brightness setting signal.

1 7. The method of claim 5 wherein the display screen is a
2 transmissive display panel, wherein the second photo-sensor
3 is mounted between the backlight and the rear surface of
4 the display panel.

1 11. The method of claim 5, wherein multiple user
2 selectable brightness settings are supported, one of the
3 brightness settings requiring less power than the other
4 supported brightness settings.

1 13. A display device, comprising:
2 a housing;
3 a display panel, mounted in said housing, having a
4 front portion comprising a viewing surface and a rear
5 portion comprising a non-viewing surface;

6 a backlight positioned behind the display panel;
7 a front photo-sensor for determining the intensity of
8 light impinging on the viewing surface of the display
9 panel;
10 a rear photo-sensor for determining the intensity of
11 light impinging on the non-viewing surface of the display
12 panel, the light impinging on the non-viewing surface
13 comprising ambient light originating from outside the
14 housing and said ambient light also entering the housing
15 from behind the non-viewing surface; and
16 a backlight intensity control circuit for controlling
17 the intensity of the backlight as a function of the
18 determined intensity of light impinging on the viewing
19 surface of the display panel and also as a function of the
20 determined intensity of light impinging on the non-viewing
21 surface of the display panel.

1 15. The display device of claim 14, wherein the display
2 screen includes a liquid crystal cell.

1 17. The display device of claim 14, further comprising:
2 a user accessible brightness control coupled to
3 the backlight intensity control circuit.

1 20. The display device of claim 13, wherein the intensity
2 control module includes means for automatically adjusting,
3 on a periodic basis, backlight intensity.

1 23. A portable computer device, comprising:
2 a housing;

3 a display panel mounted in said housing, having a
4 front portion comprising a viewing surface, and a rear
5 portion comprising a non-viewing surface;

6 a backlight positioned behind the display panel;

7 a front photo-sensor for determining the intensity of
8 light impinging on the front portion of the display panel;

9 a rear photo-sensor, mounted inside said housing
10 behind said display panel, for determining the intensity of
11 light impinging on the rear portion of the display panel,
12 the light impinging on the rear portion of the display
13 panel comprising ambient light entering the housing from
14 outside the housing, said ambient light also entering the
15 housing from behind the non-viewing surface;

16 a backlight intensity control circuit for controlling
17 the intensity of the backlight as a function of the
18 determined intensity of light impinging on the front
19 portion of the display panel, and as a function of the
20 determined intensity of light impinging on a rear portion
21 of the display panel; and

22 a base portion, comprising a keyboard and a central
23 processing unit, connected to the display panel.

1 24. The portable computer device of claim 23, wherein the
2 display panel includes a transmissive liquid crystal
3 display screen and a housing, the computer device further
4 comprising:

5 a hinge for connecting the display panel to the
6 base portion.

1 25. The portable computer device of claim 24,
2 wherein the backlight intensity control circuit
3 is included in the base portion; and
4 wherein the backlight intensity control circuit
5 includes means for automatically adjusting, on a periodic
6 basis, backlight intensity.

1 26. The display device of claim 13, further comprising:
2 a device for directing the ambient light through said
3 non-viewing surface, the device for directing ambient light
4 being moveably attached to said housing; and
5 a diffuser located behind the display panel, the
6 diffuser being moveably attached to said housing at a
7 different location from the device for directing the
8 ambient light, the diffuser for diffusing at least some of
9 said ambient light before that ambient light passes through
10 said non-viewing surface of the display panel.

1 27. The portable computer device of claim 23, further
2 comprising:
3 a device for directing said ambient light through said
4 non-viewing surface, the device for directing said ambient
5 light being moveably attached to said housing; and
6 a diffuser located behind the display panel, the diffuser
7 being moveably attached to said housing at a location
8 different from said device for directing said ambient
9 light, the diffuser for diffusing at least some of said
10 ambient light before that ambient light passes through said
11 non-viewing surface of the display panel.
